

Every car has papers. Every paper has a trail.

Cruz Ride Auto's interface system. Trust is the product, so verification state is a first-class citizen of the palette, the components and the copy — not a badge bolted on at the end.

DESKTOP BASELINE

00 — THE IDEA

Signature

Three rules make a Cruz screen recognisable at a glance, before any colour is read. They come out of the logo's motion and out of Kenyan road furniture — plates, cover notes, stamped paper.

The 14° cut

One skewed red rule per surface — masthead, section marker, boost ribbon. Never more than once in view.

Plated identifiers

Anything a human would read aloud to verify — plate, ref, receipt code — is boxed and monospaced.

Round = trust, angled = paid

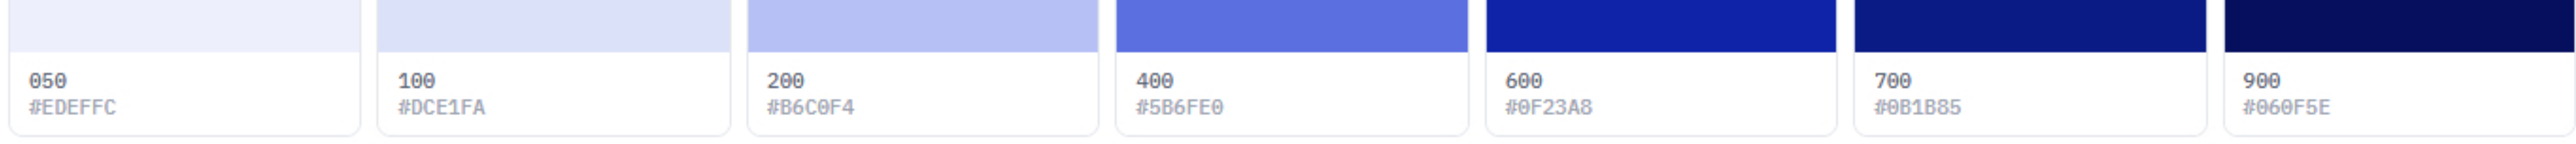

Shape carries the distinction, so commerce can never impersonate verification — even in greyscale.

01 — FOUNDATION

Color

Straight off the logo: **Cruz Blue** is deep and cobalt — it carries actions, never status. **Cruz Red** is the brand's edge and the danger colour both: red always means stop.

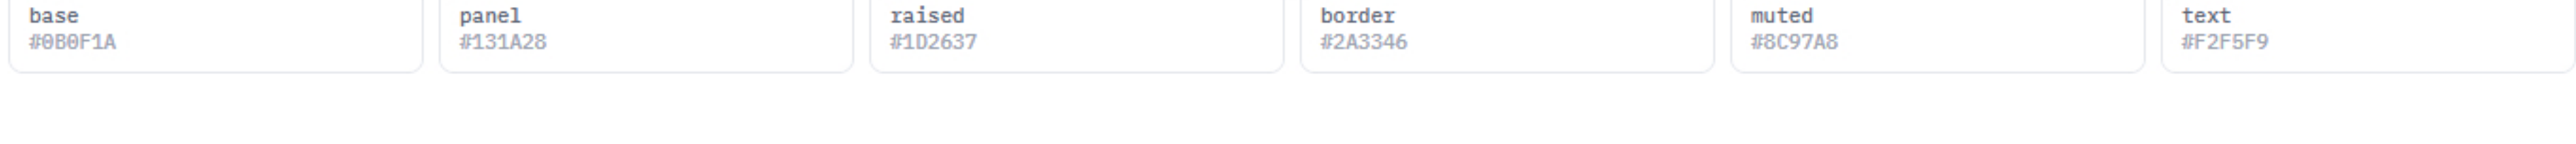

CRUZ BLUE RAMP

OPS SURFACE · ADMIN SHELL

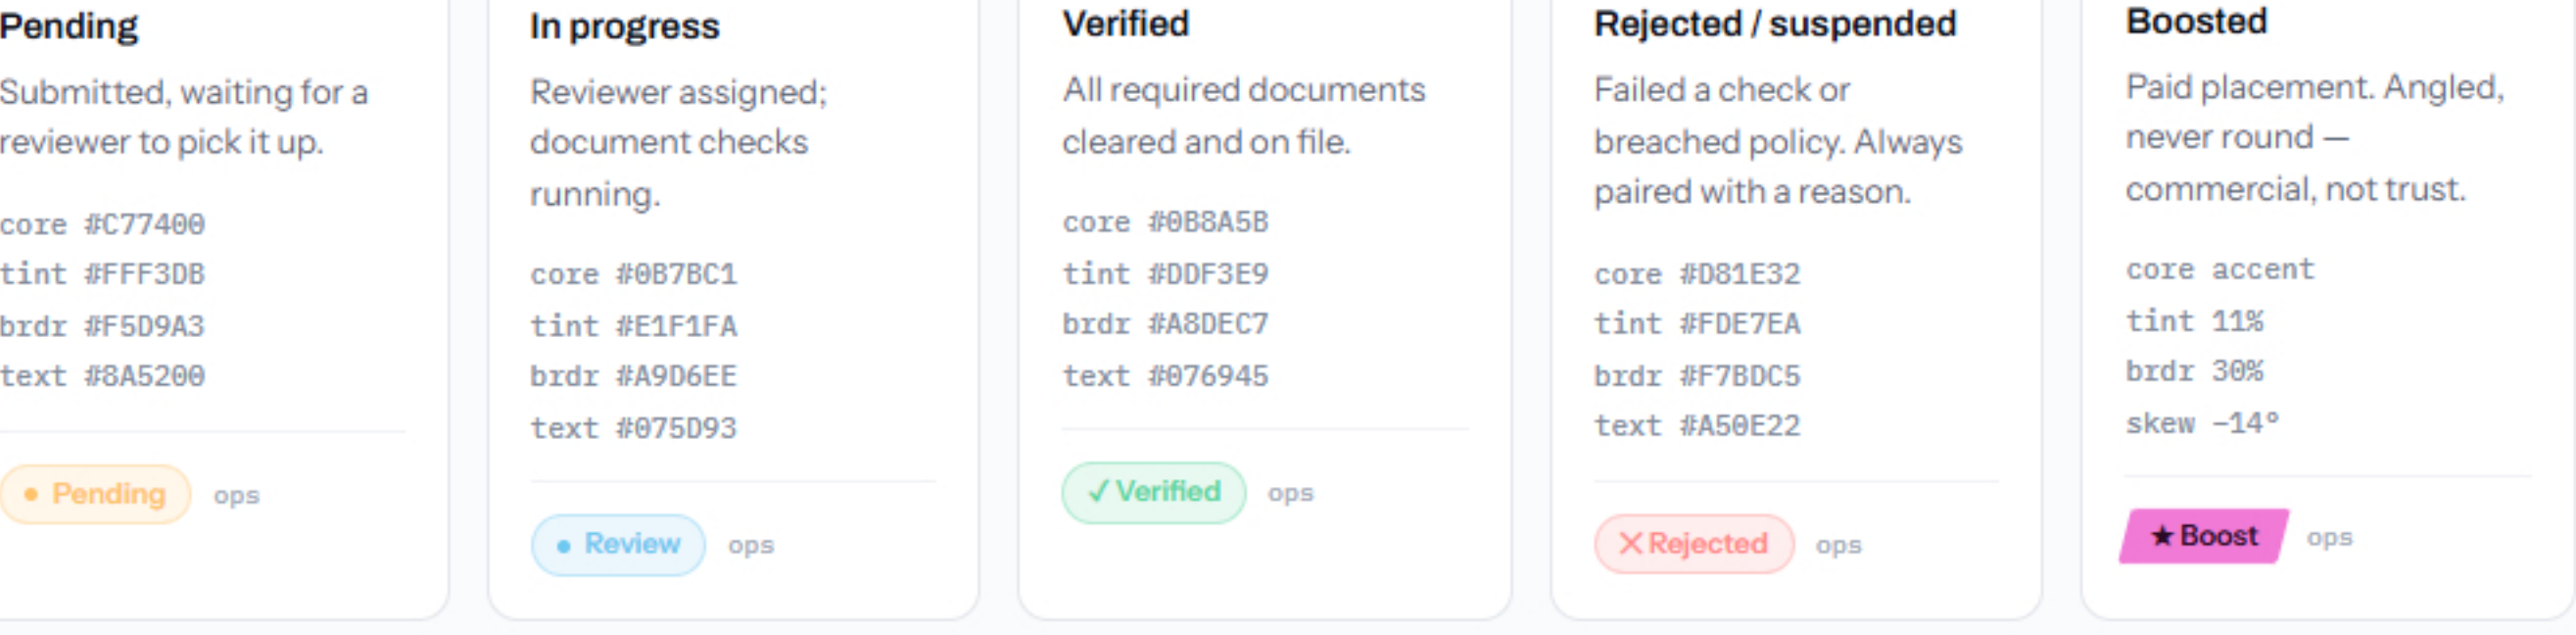

02 — FOUNDATION

Status system

Five states, one meaning each, identical in all three portals. Each ships as a quartet for light surfaces and a pair for the ops surface — never invent a sixth.

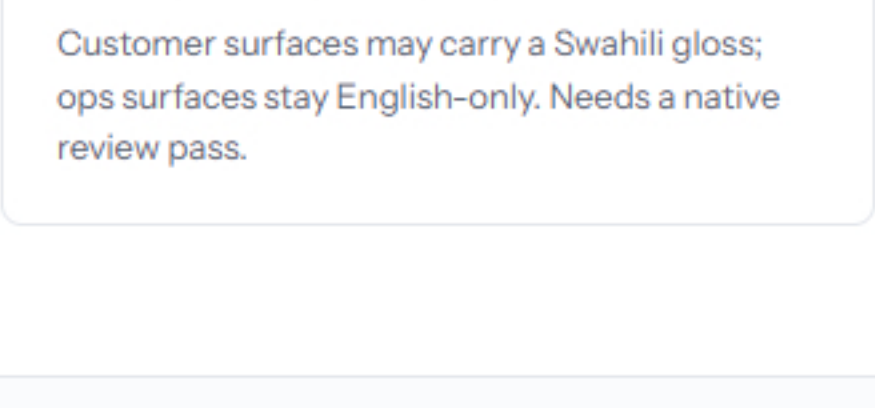

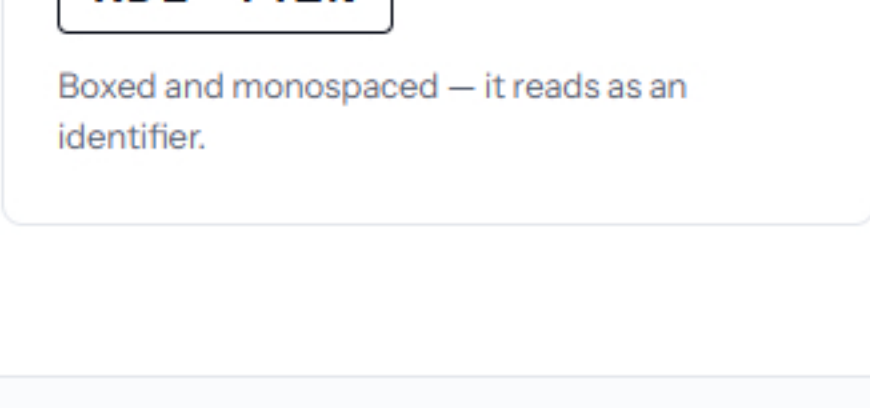

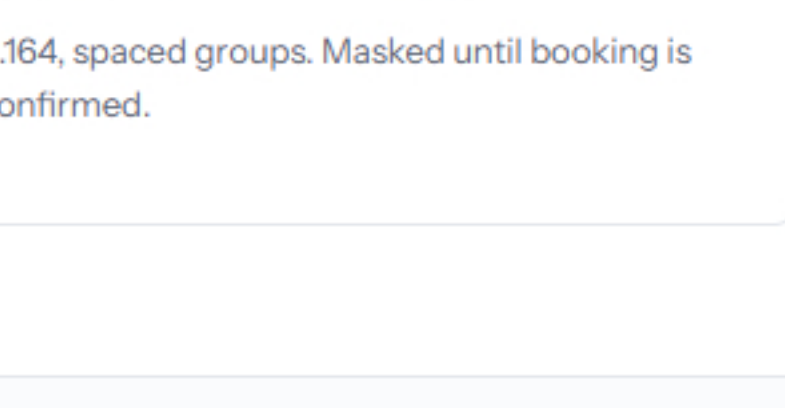

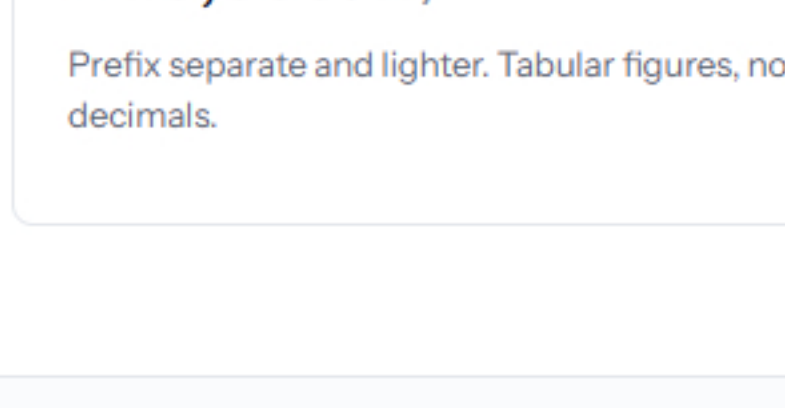

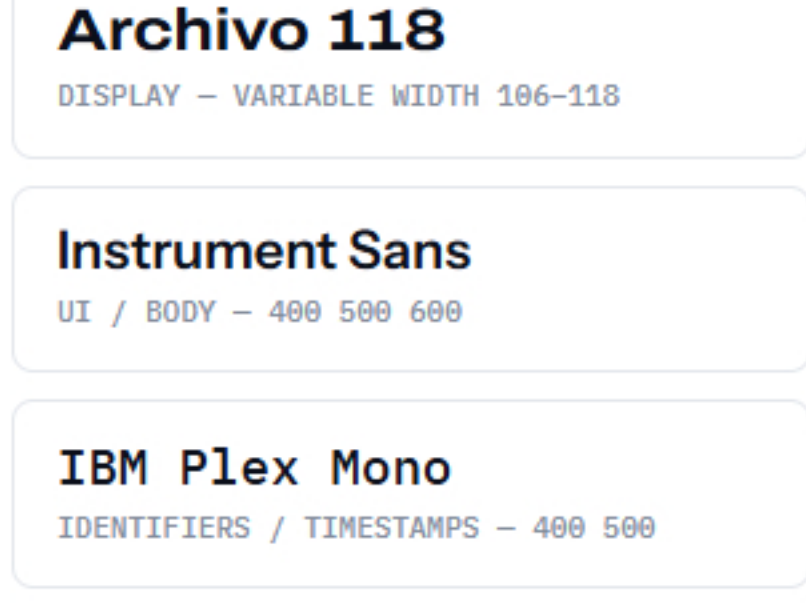

Colour never carries state alone. Dot or glyph, plus a word, every time — greyscale prints, colour-blind reviewers and cheap monitors all have to survive it.

03 — FOUNDATION

Typography

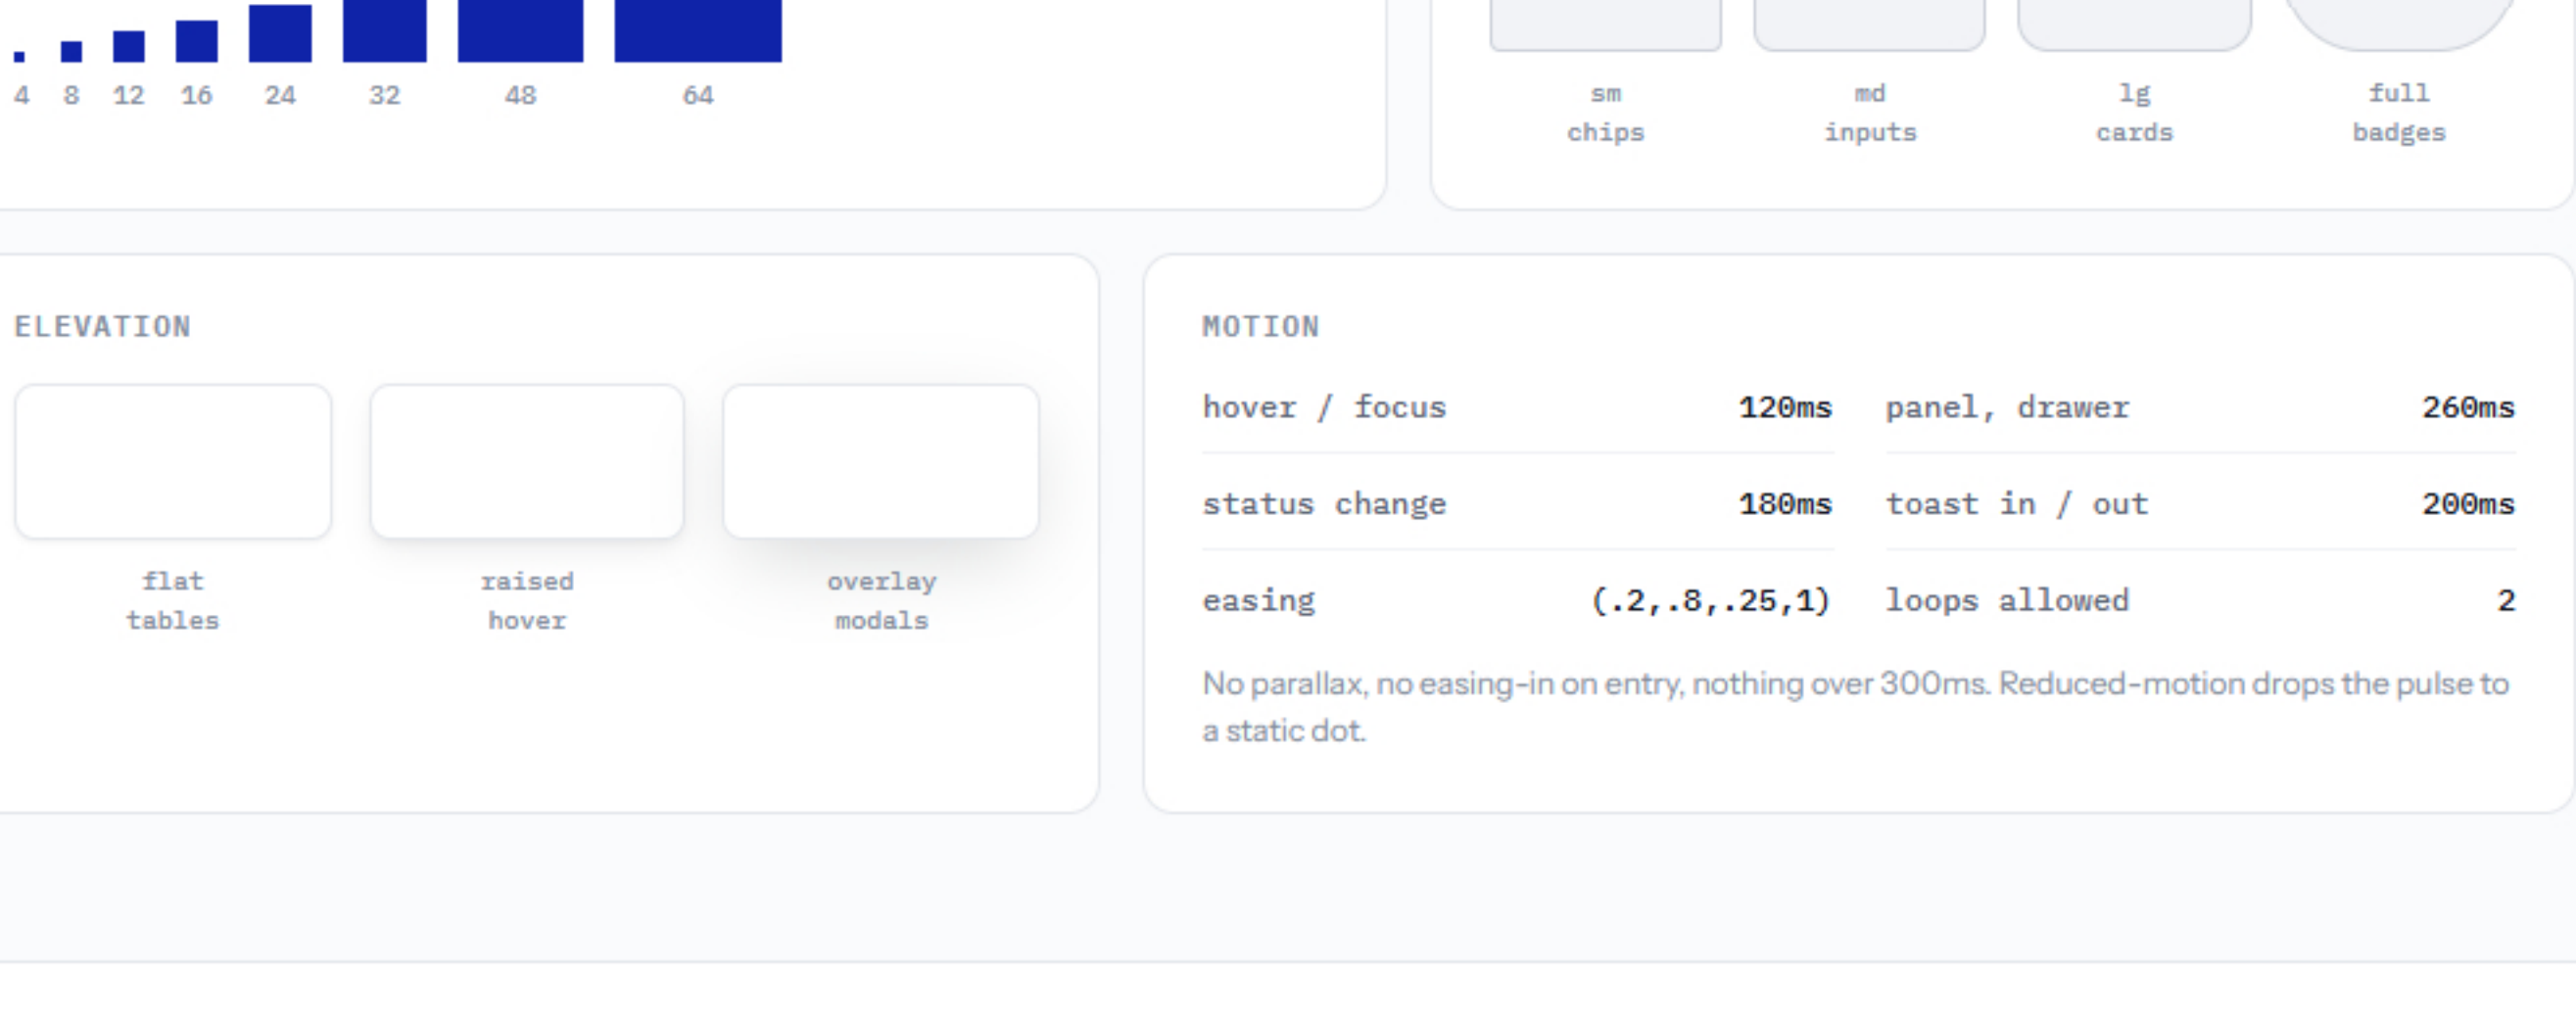

Archivo runs wide on display sizes — with 112 gives headlines the stretched, engineered feel of signage instead of another neutral grotesque. Instrument Sans handles UI text. Plex Mono is for identifiers only.

04 — FOUNDATION

Geometry & motion

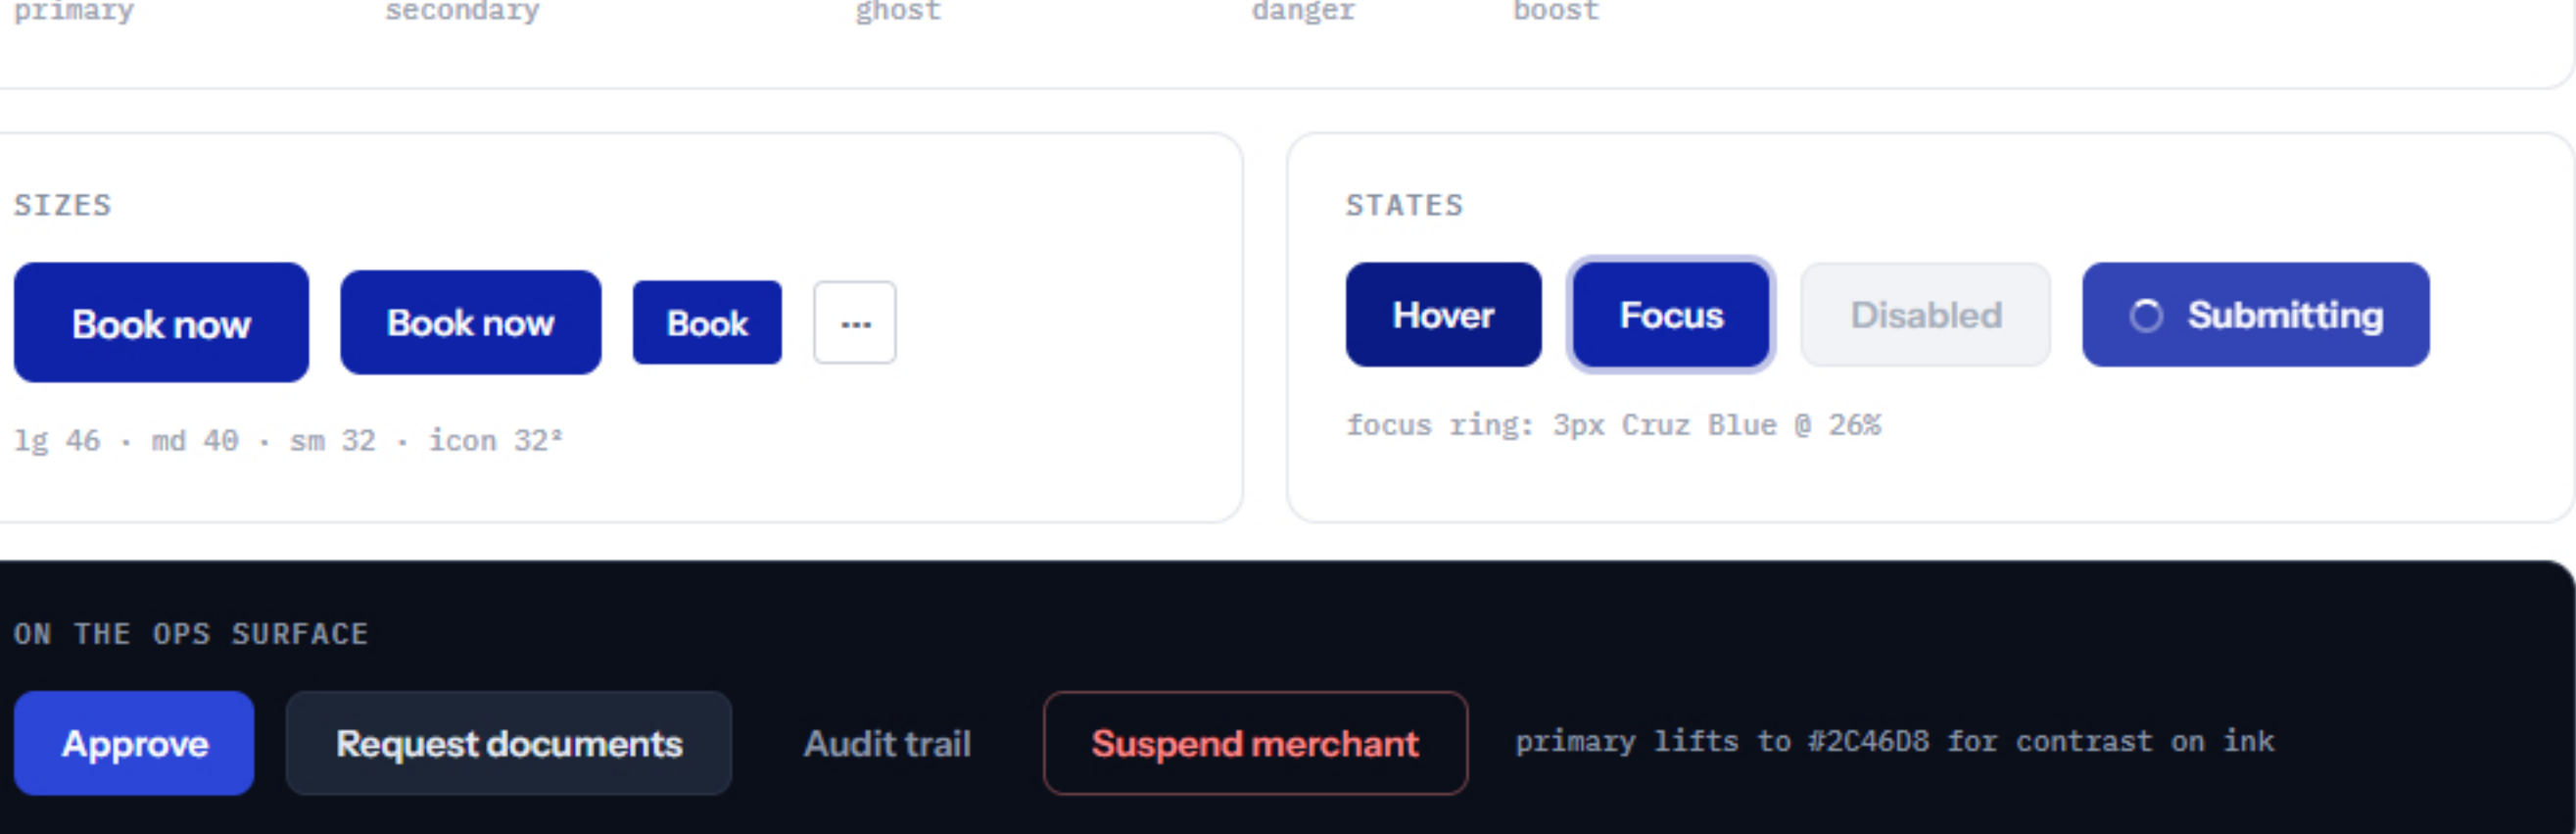

4px base, three radii, three elevations. Motion is short and mechanical — this is a work tool. Only two things in the product loop: the in-progress dot and the skeleton shimmer.

05 — COMPONENT

Buttons

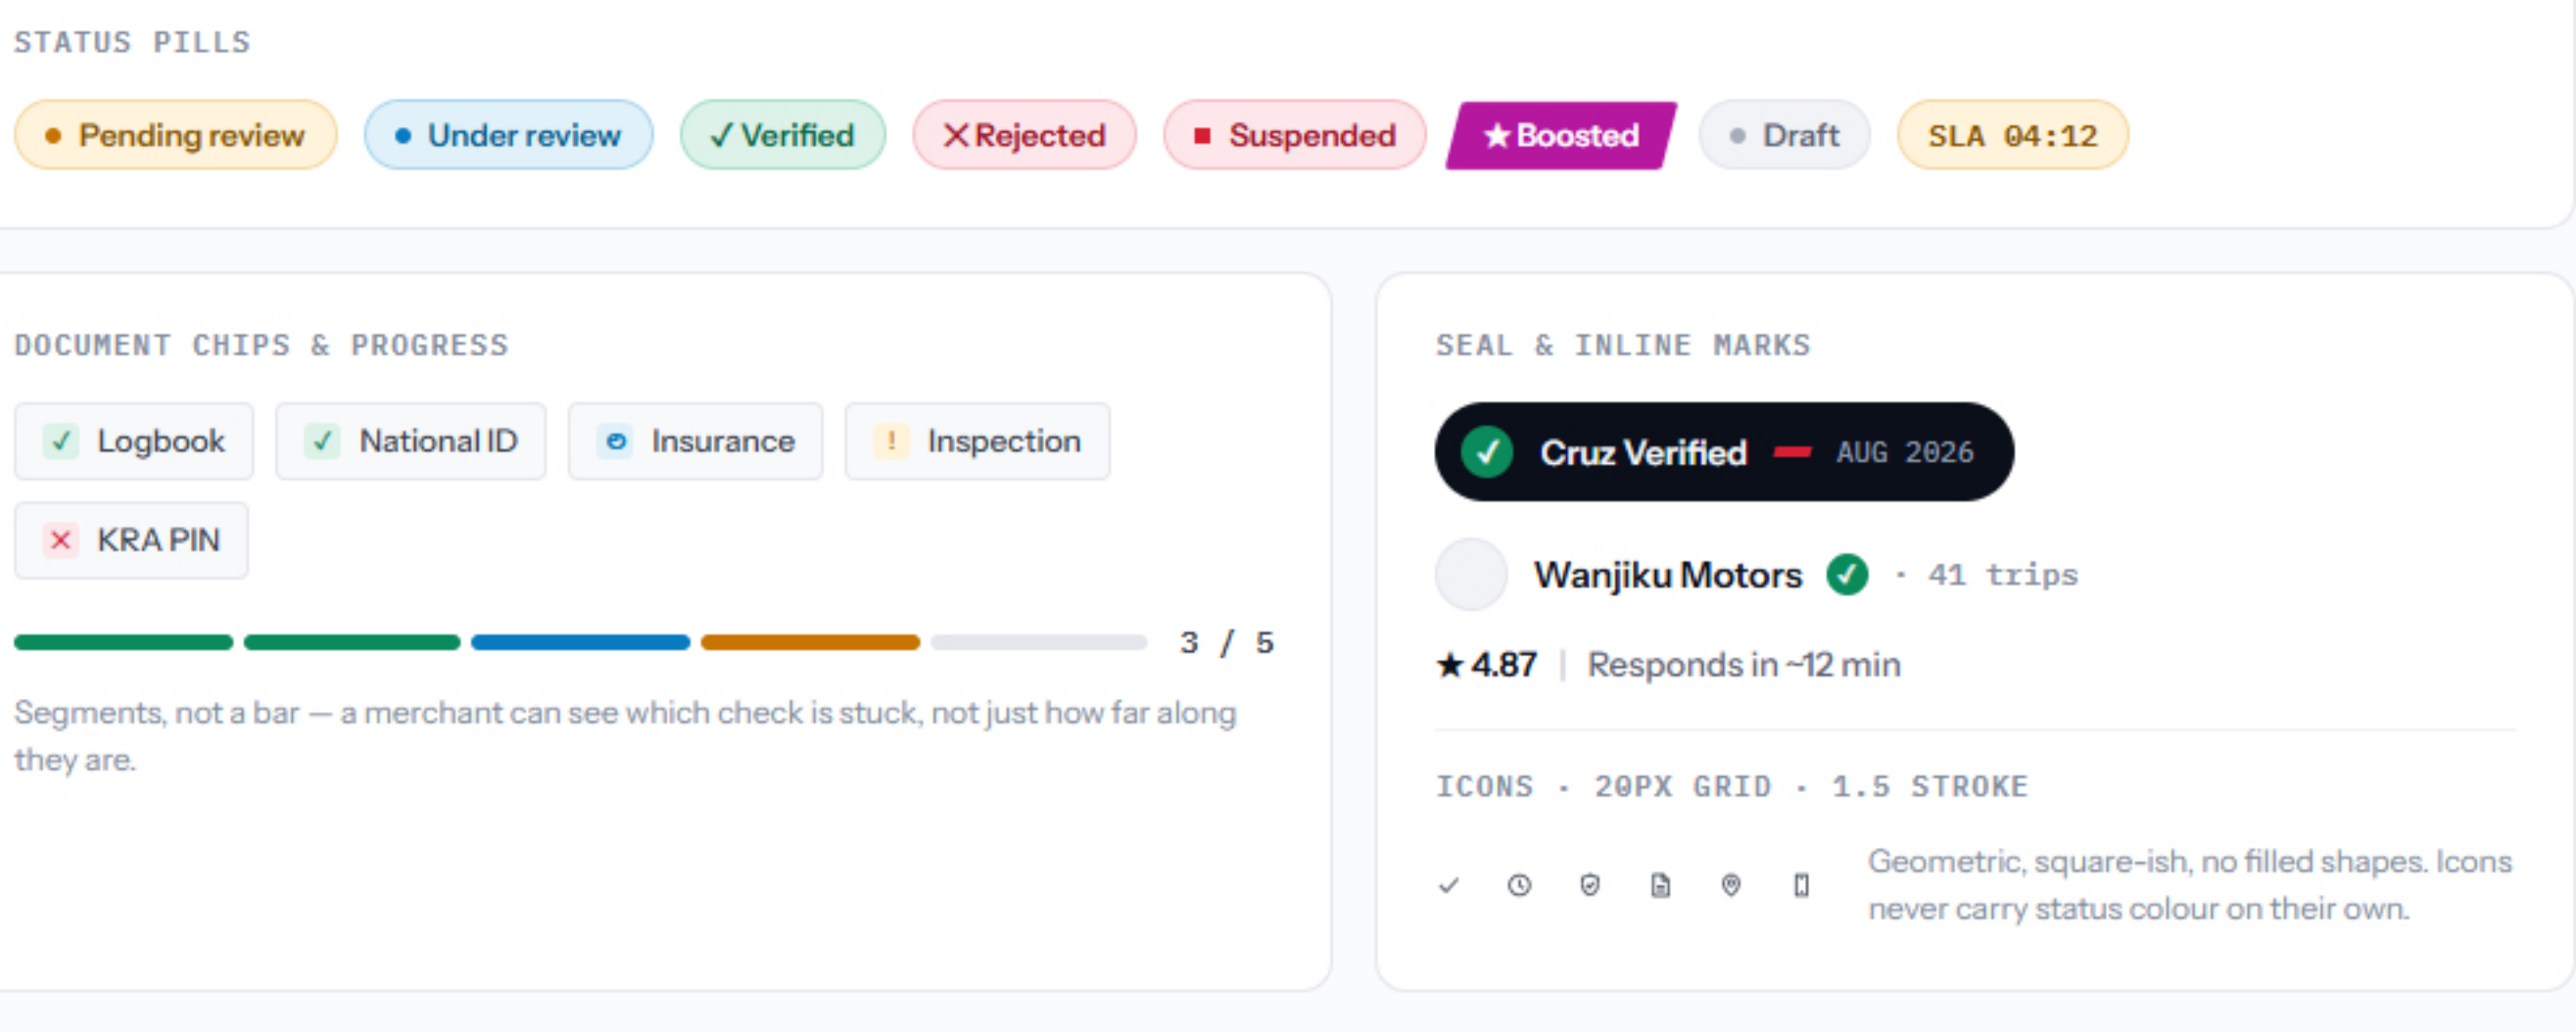

One primary per view. Irreversible compliance actions use danger and always open a reason dialog. Boost is the only skewed control in the product.

06 — COMPONENT

Badges, seals & icons

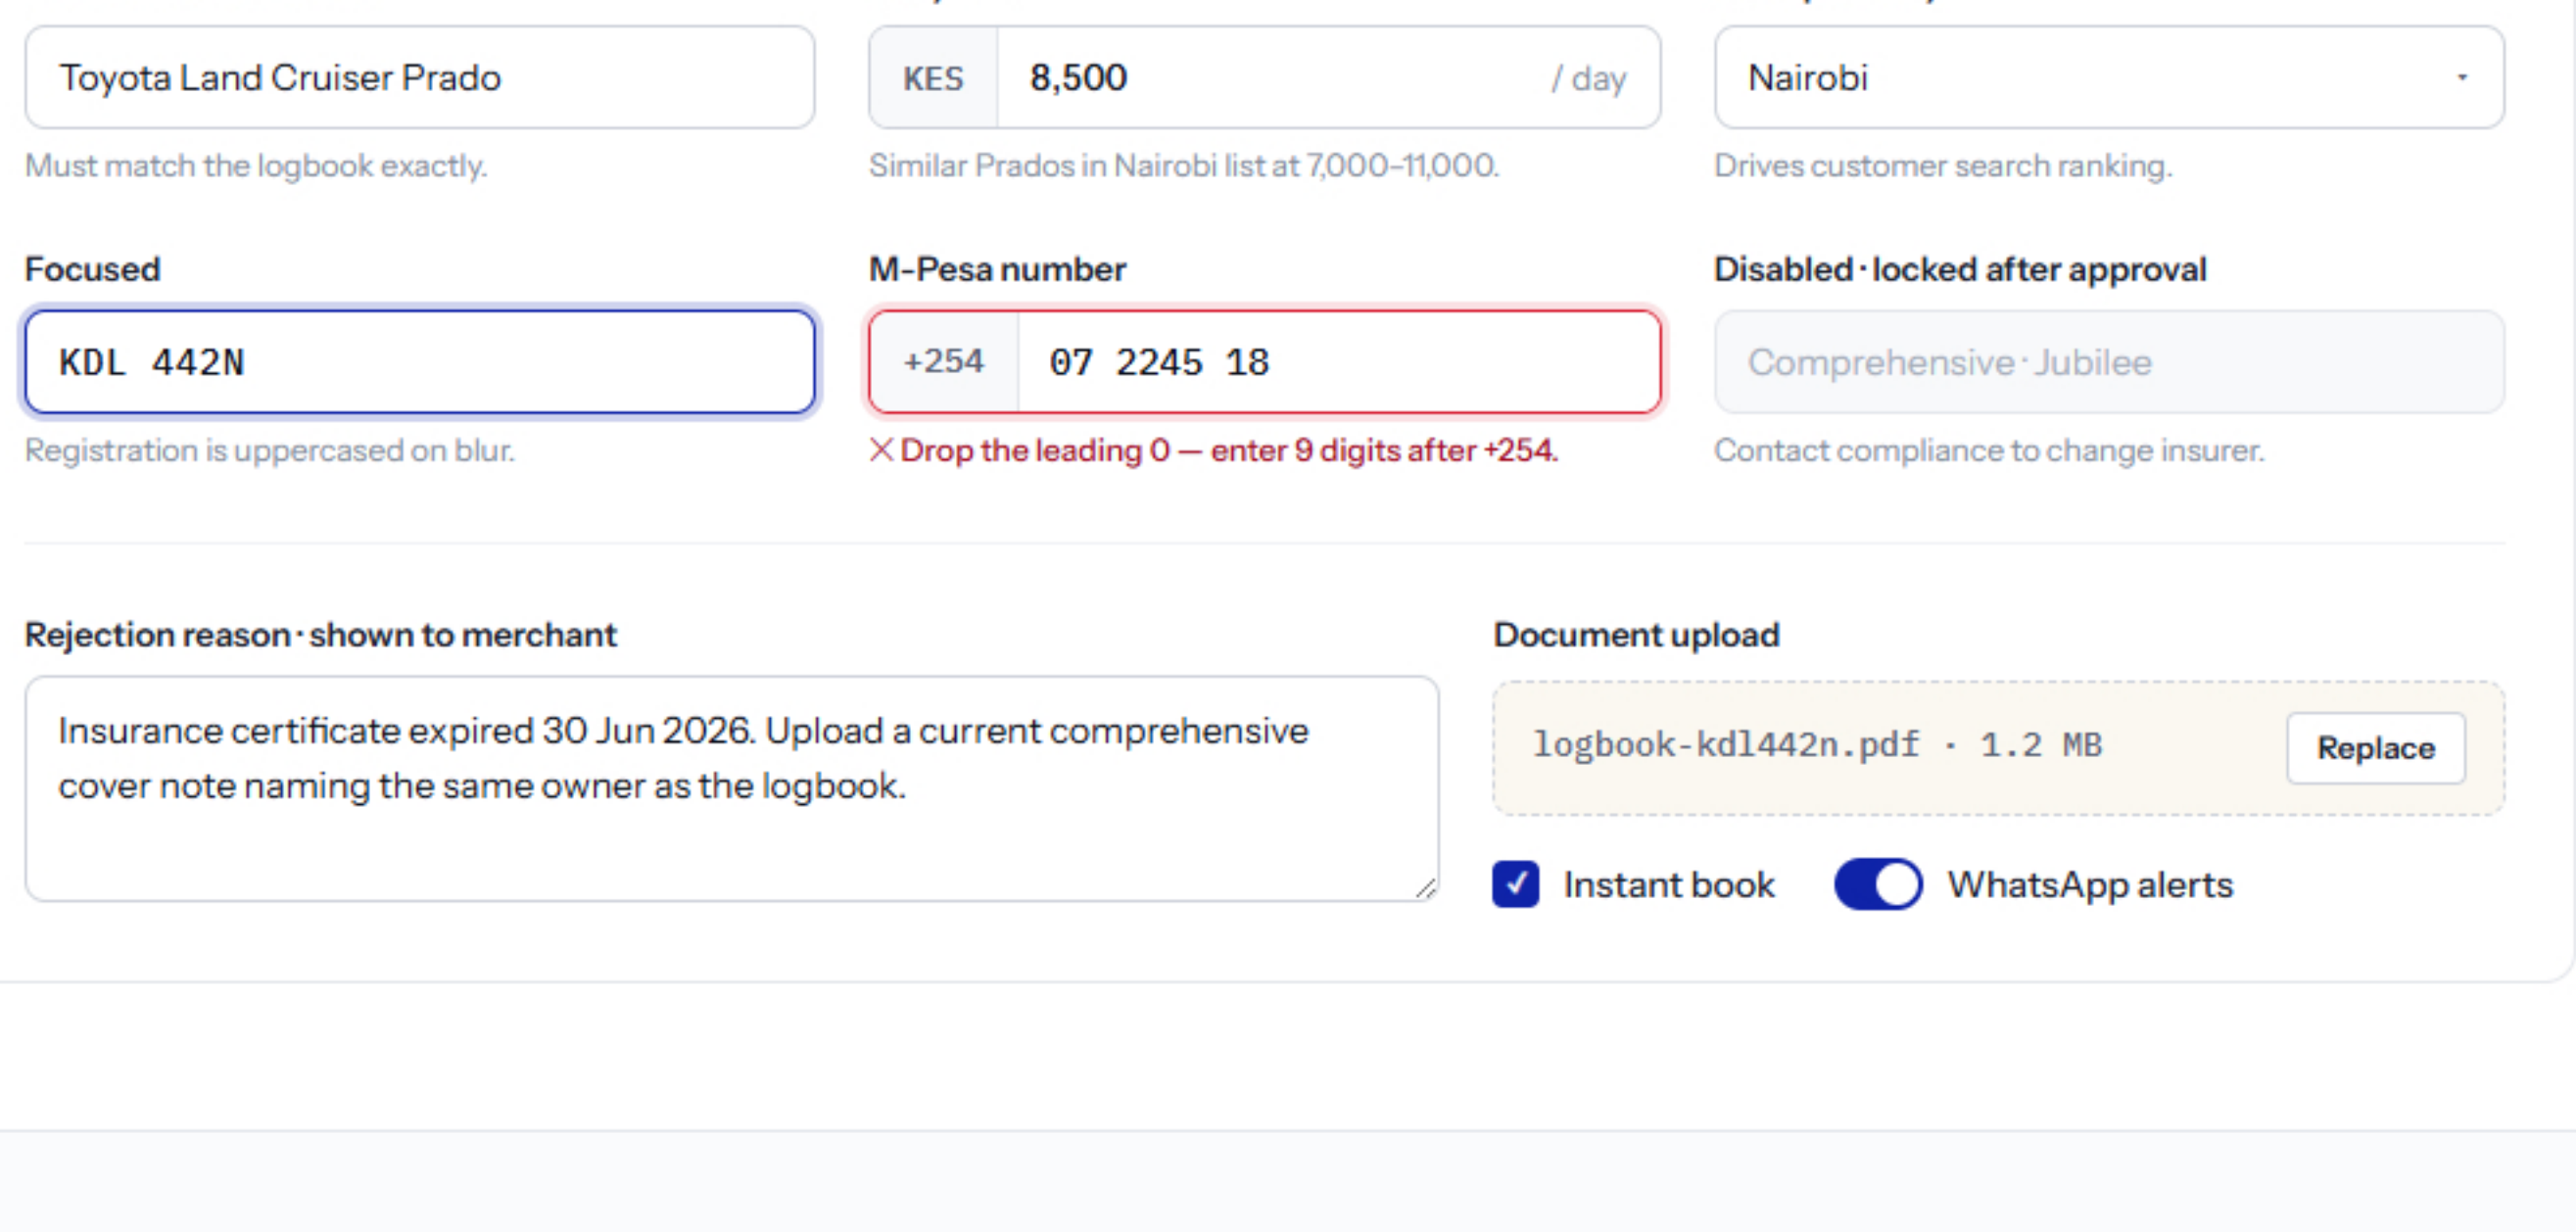

Pills carry entity state; chips carry per-document state; the seal is issued by Admin alone and is the only place the wordmark appears inside the product.

07 — COMPONENT

Form inputs

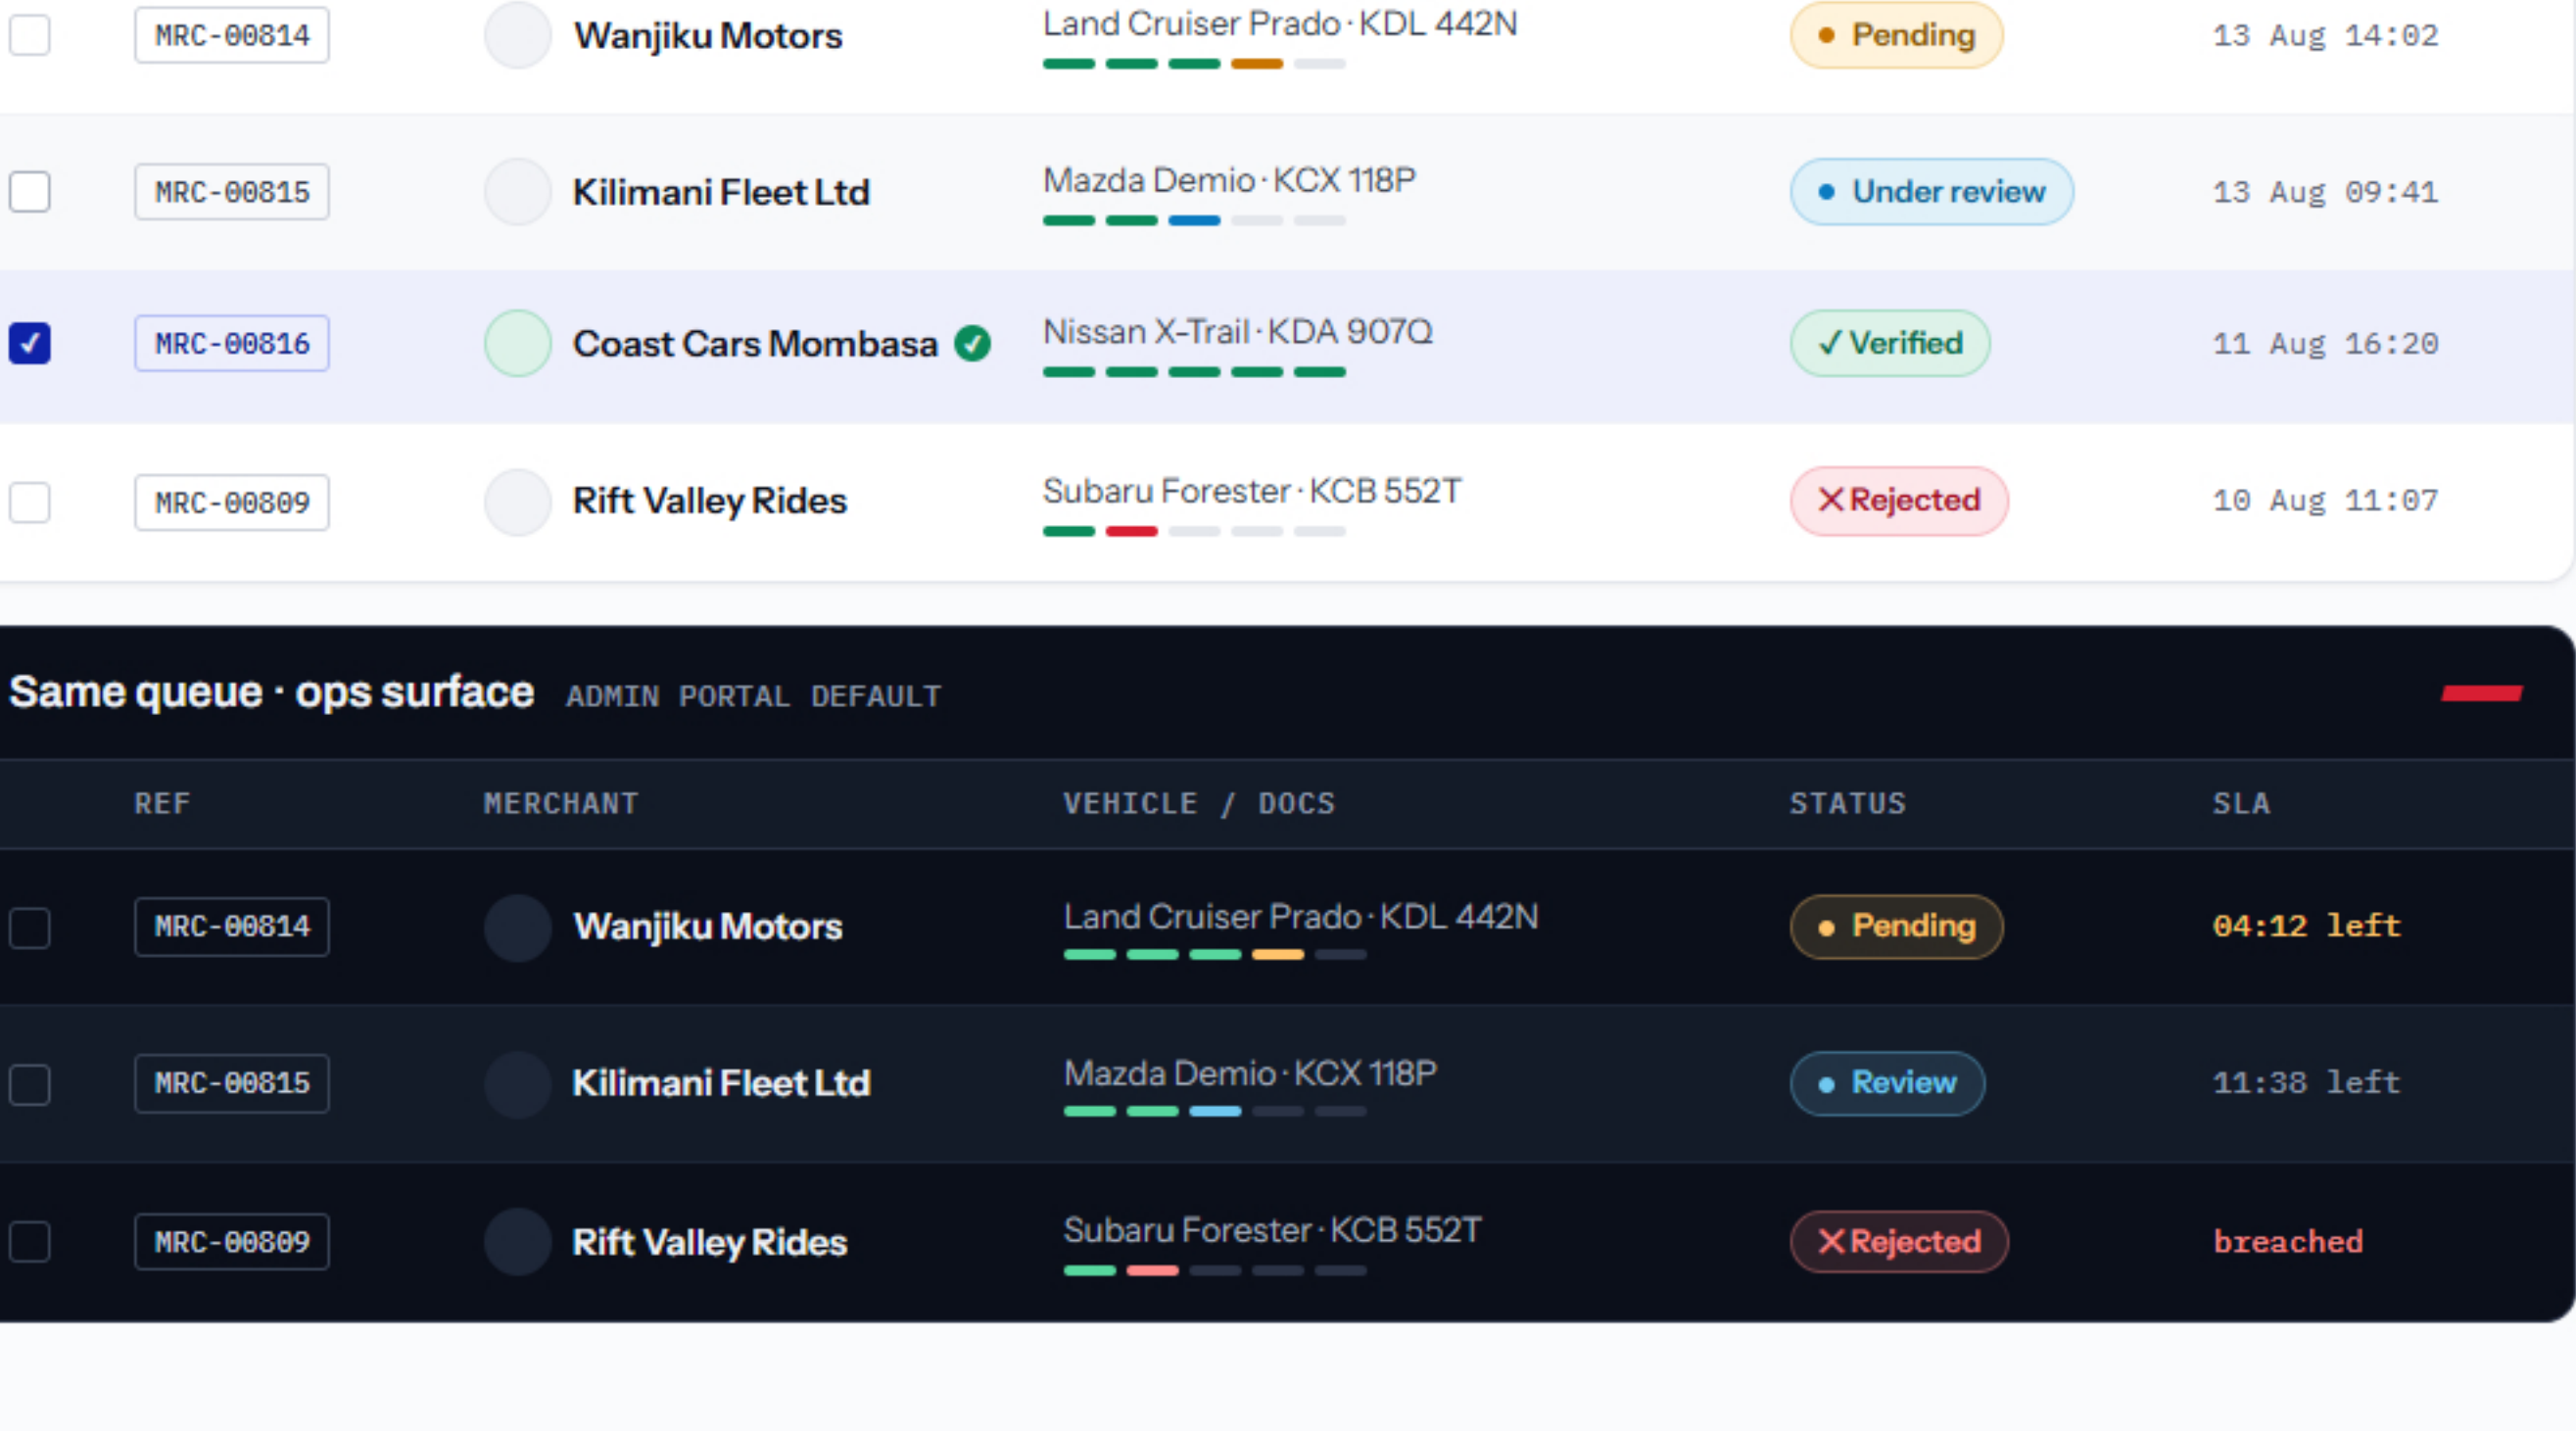

Label above, helper below, 40px control height. Locale affordances are built into the component, not bolted on: KES prefix, +254 dial code, county select. Errors state the fix, not the failure.

08 — COMPONENT

Table rows

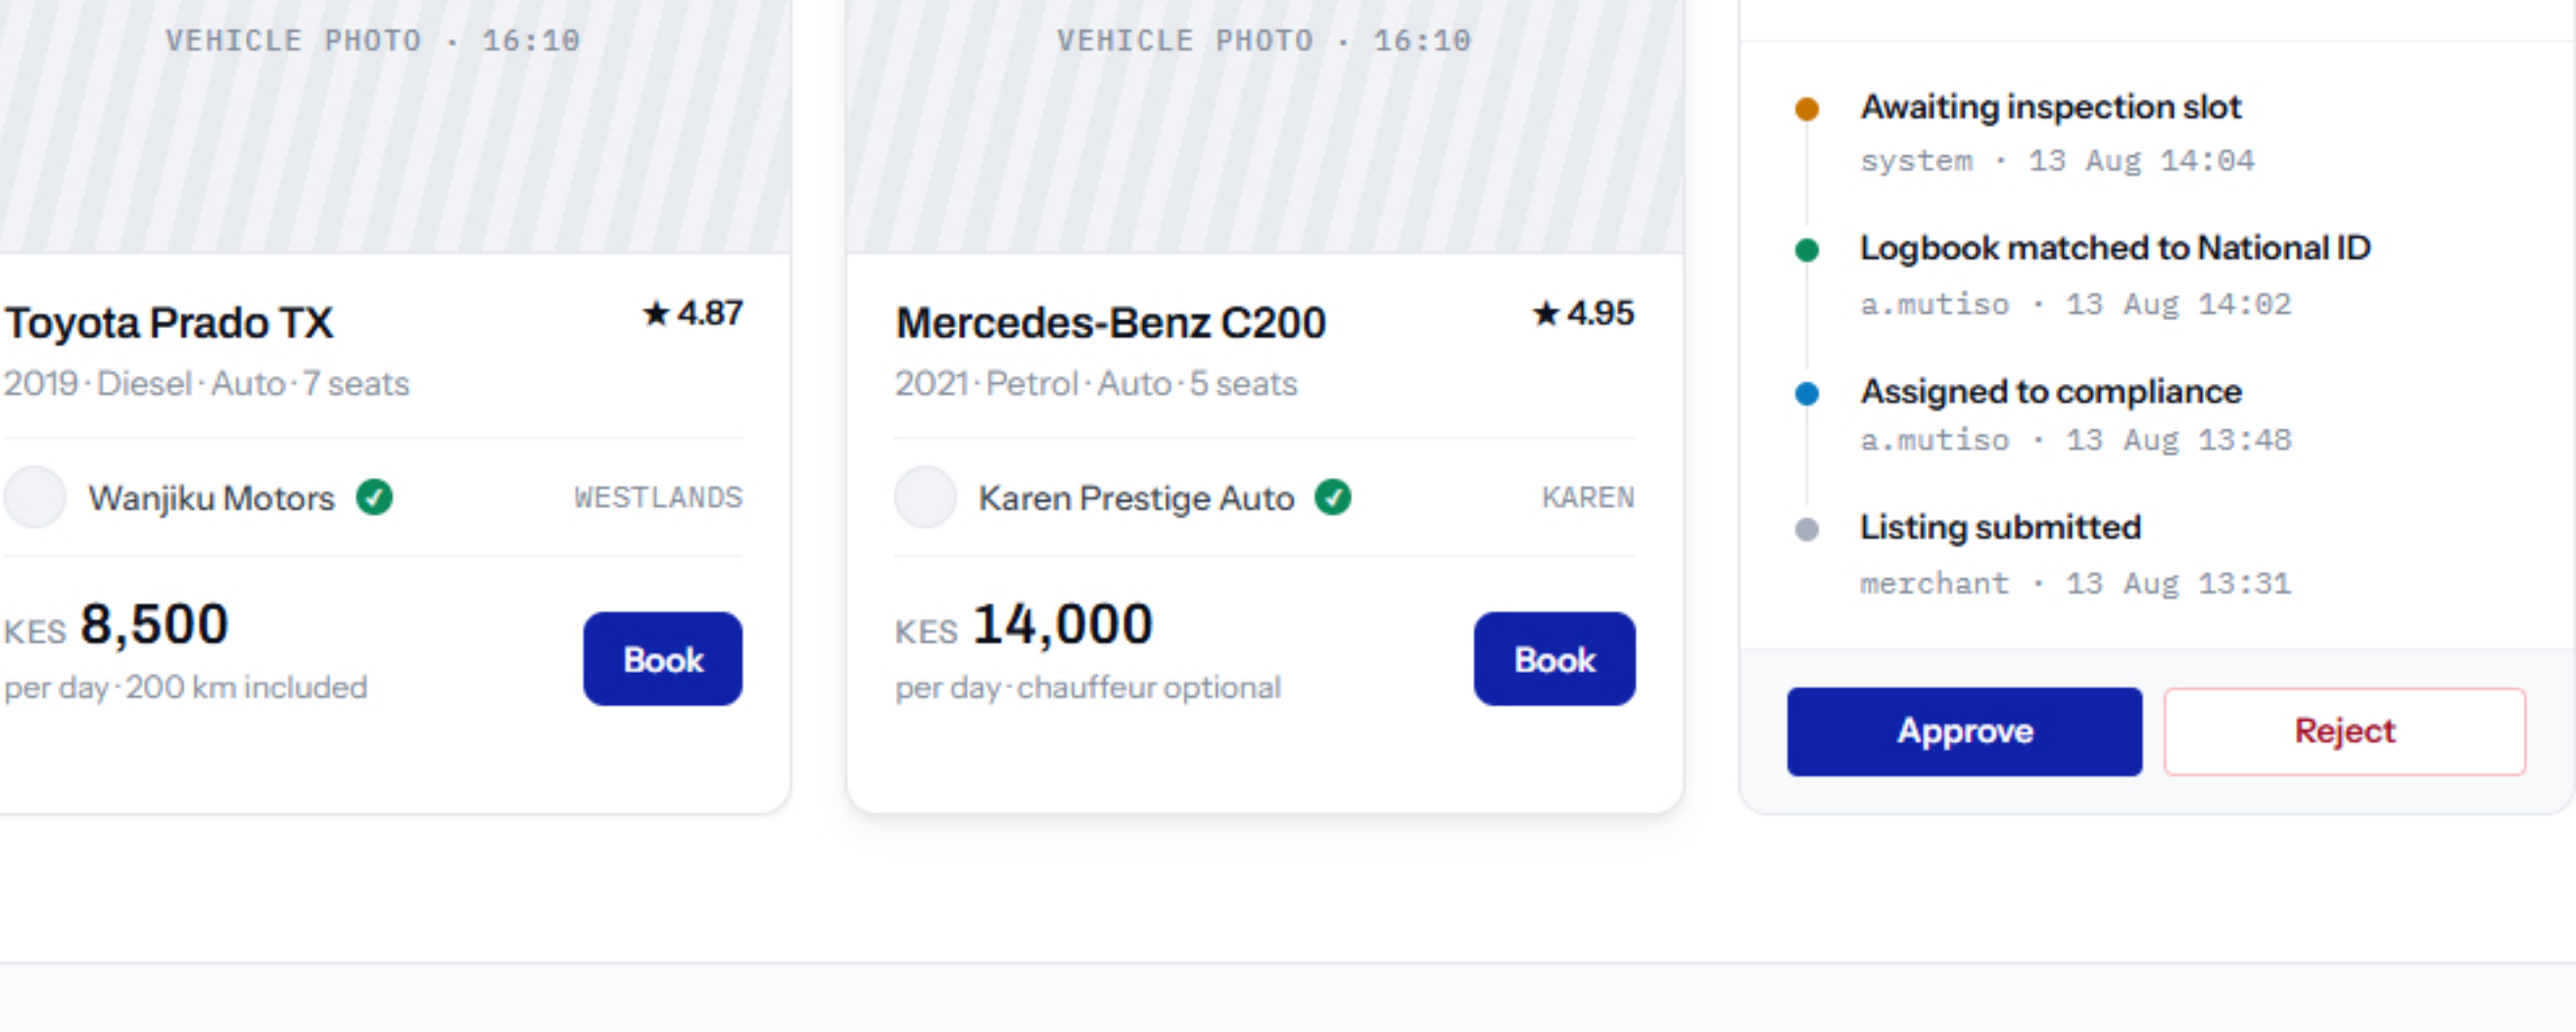

The admin workhorse, specified on both surfaces. Plated ref left, document segments under the vehicle, status and SLA right. Flagged rows carry a 2px left marker so a queue can be triaged without reading a word.

09 — COMPONENT

Cards, trail & paper

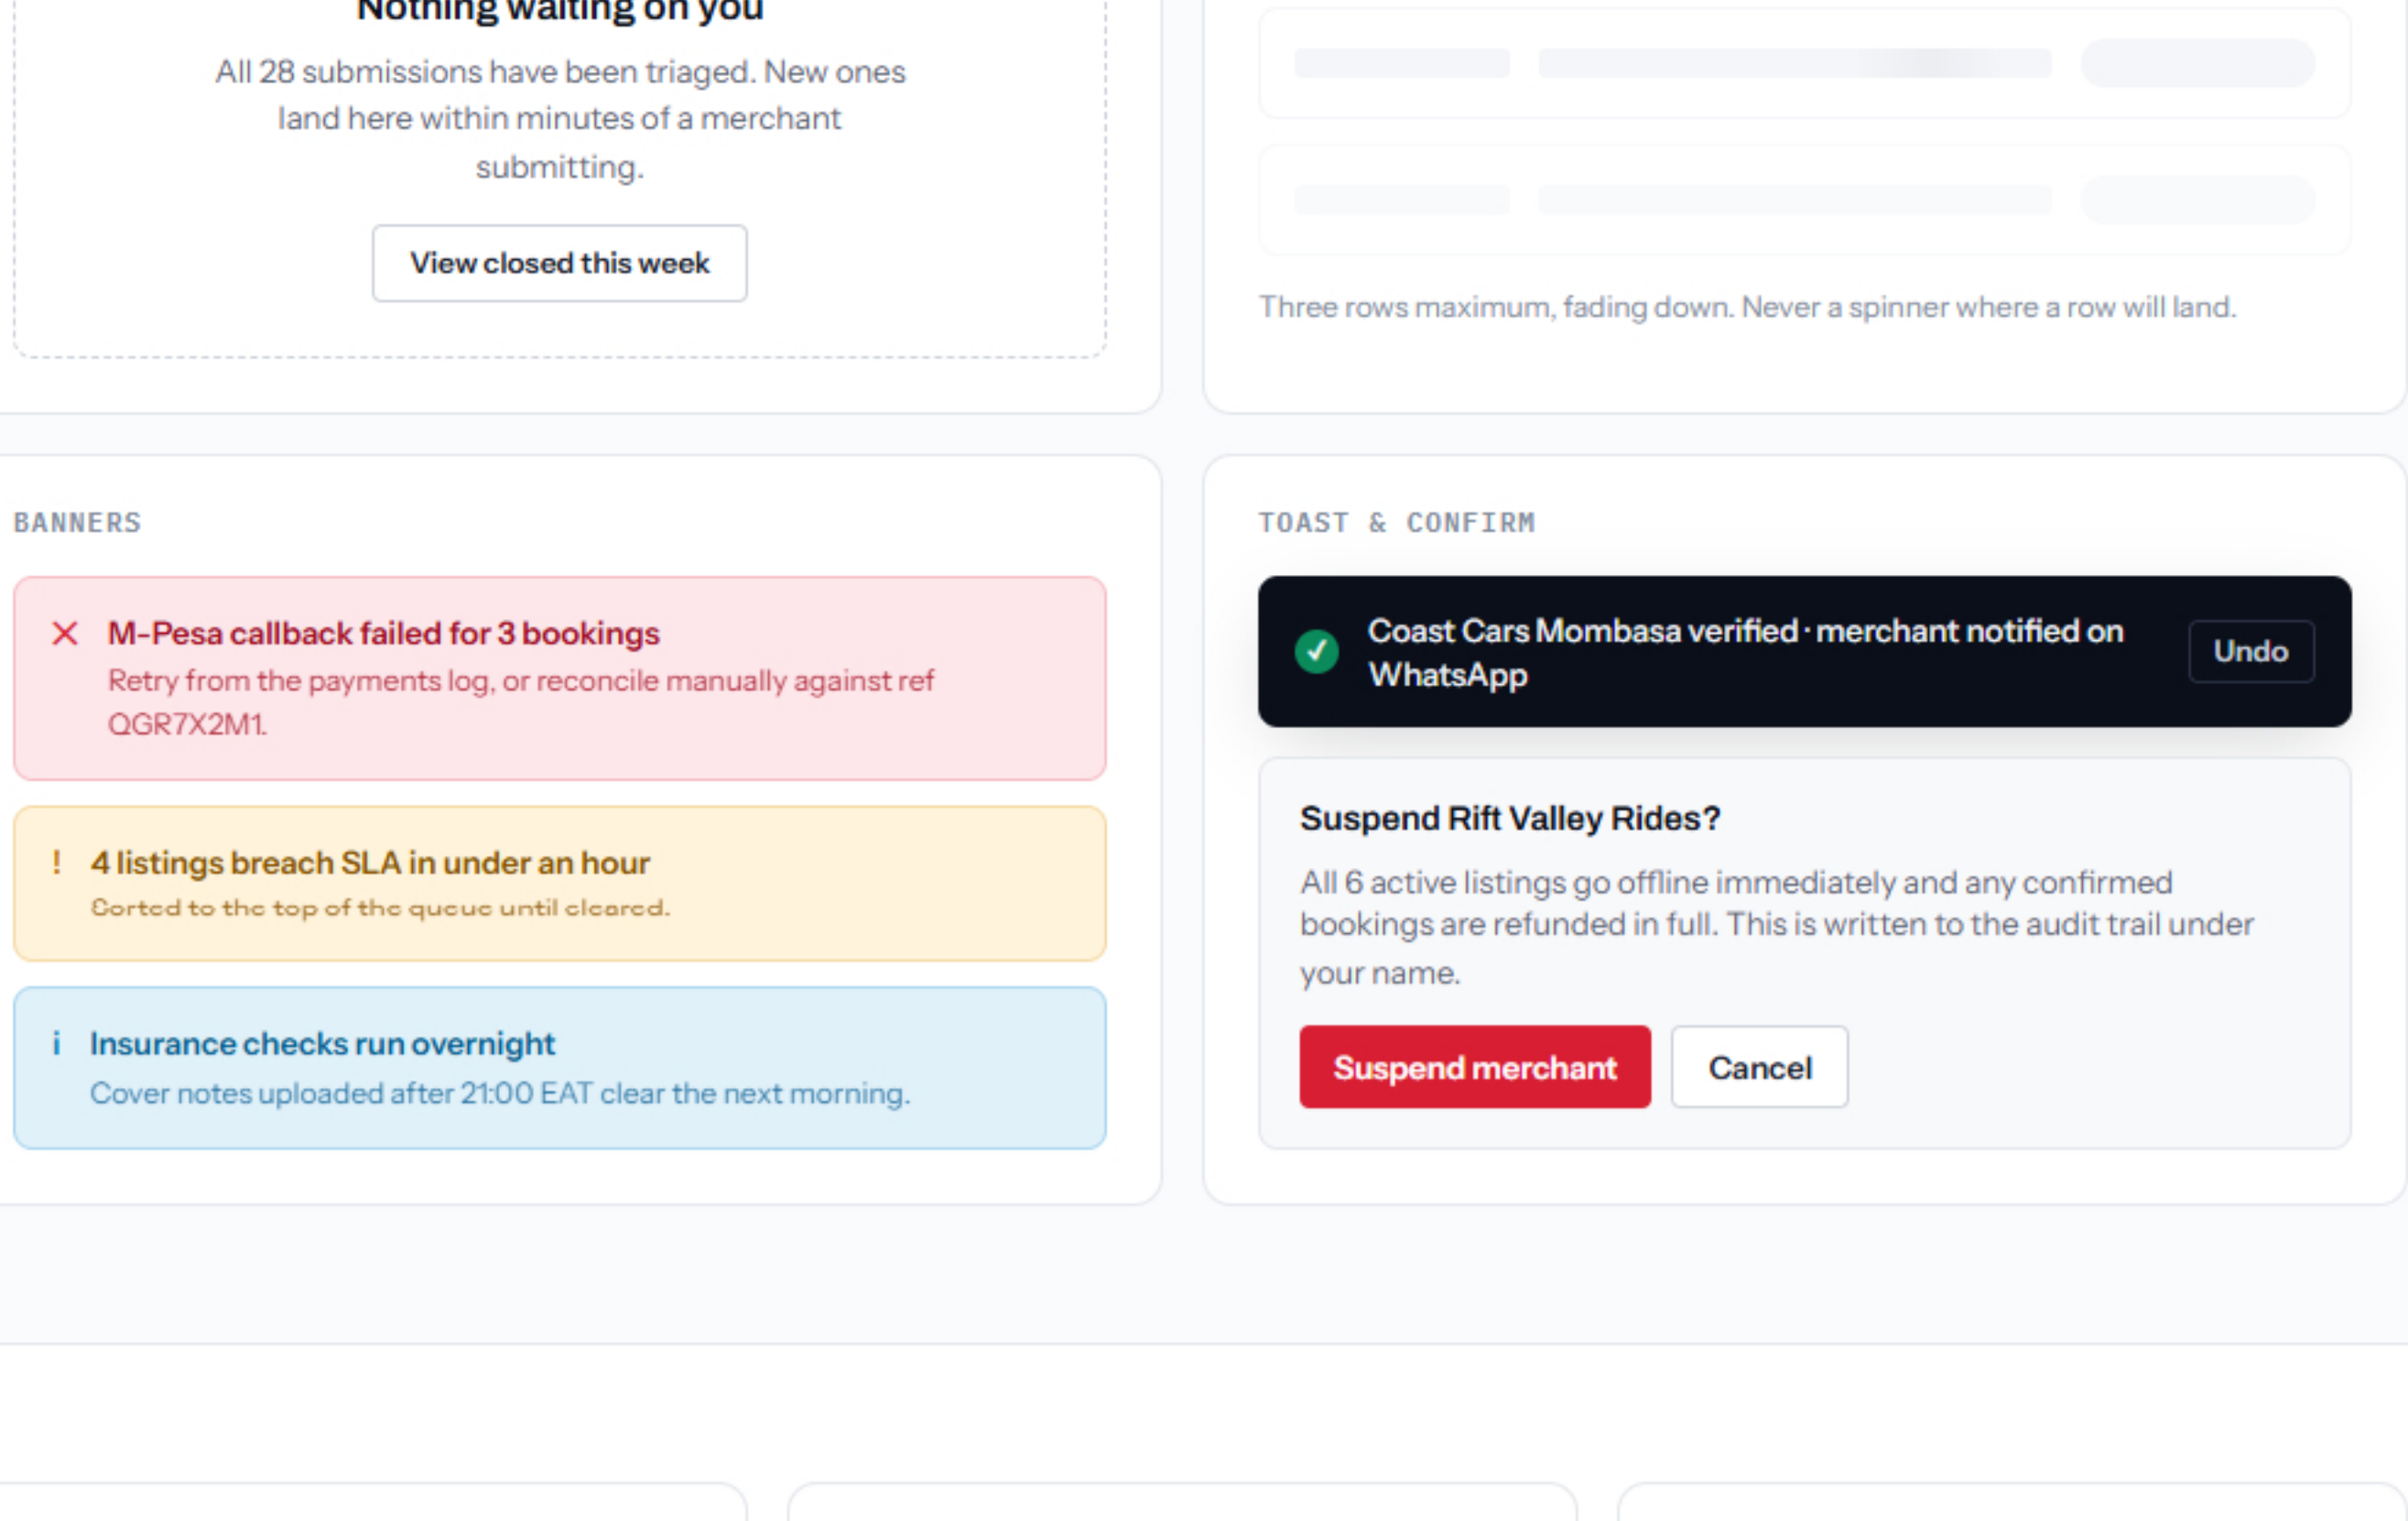

The listing card is the customer's unit of trust. The audit trail is append-only, with an actor on every line. Anything that came from a printer or a bank — receipts, cover notes — sits in type — no third-party marks are reproduced here.

10 — COMPONENT

The other states

Half of a marketplace's screen time is empty, loading, or broken. Specified once here so nobody improvises them later — every one names the next action.

11 — COMPONENT

Local rails

Payment and messaging are components, not settings. The M-Pesa confirmation is rendered on paper stock because that is what a Kenyan customer is used to screenshotting and forwarding. Partner names are set in type — no third-party marks are reproduced here.
